

ServiceM8 Add-on

Yeastar SMS Gateway

SMS Dashboard

Automated & manual SMS for field-service businesses — inside ServiceM8

Product overview for partners & clients · Version 1.0 · Demo screenshots included

A cloud-hosted SMS platform that lives inside **ServiceM8**. Staff manage templates, automation rules, delivery logs, and customer replies from one dashboard. Messages go out through the customer's own **Yeastar TG400** gateway (their SIMs, their numbers) — no third-party SMS credit middleman.

What it does

When a job is created, a technician goes en route, or a job is completed, the system can automatically text the customer. Staff can also open any job and send a one-off SMS with a live preview. Customer replies appear in an inbox matched to the job by phone number.

Automatic job SMS

Rules fire on job created, status change, en route, or completed — using your message templates.

Manual Send SMS

From any job card: pick recipient + template, preview, send — without leaving ServiceM8.

Two-way inbox

Inbound replies from the Yeastar gateway show up in a conversation-style inbox.

Delivery log & analytics

See what was sent, status, and 7-day volume. Test the gateway from Settings.

Who it's for

- Trades and field-service businesses on ServiceM8 that own (or will buy) a Yeastar TG400
- Teams that want branded SMS from their own SIM numbers, not a shared SaaS sender ID
- Owners who don't want a PC running 24/7 in the office — the app runs in the cloud

Automation rules

Choose when to send SMS and which template to use.

+ Add rule

Rule name	When	Status match	Template	On
Booking confirmed	Job created	—	booking_confirmed	Yes
Technician on the way	Technician en route	En Route, Dispatched	en_route	Yes
Job completed thank you	Job completed	Completed	job_complete	Yes
Quote follow-up	Status changed	Quote	quote_followup	Yes

When: Job created · Status changed · En route · Job completed

Save rules

Rules tab — map job events to templates (booking confirmed, en route, completed, quote follow-up)

Send SMS

Job action modal — recipient, template, live preview, send

How it works (simple)

1. ServiceM8 job event or staff action → cloud SMS app
2. App loads full job + customer from ServiceM8 API
3. Rules/templates build the message → Yeastar TG400 sends via office SIMs
4. Customer replies → shown in Inbox

ServiceM8 → Cloud app (AWS) → Office router → Yeastar TG400

Key selling points

Point	Why it matters
Lives inside ServiceM8	No separate login for day-to-day SMS — staff already know the workflow
Uses client's Yeastar hardware	Own SIMs, own numbers, predictable mobile costs
Cloud hosted	No always-on office PC; works while the site router + Yeastar stay powered
Automation + manual	Cover standard lifecycle texts and one-off messages
Safe rollout	Dry-run / UAT mode until go-live; rate-limited sends protect the gateway

What's included for the buyer

- ServiceM8 add-on (SMS Dashboard menu + Send SMS job action)
- Cloud backend (templates, rules, outbound log, inbox, settings)
- Yeastar TG400 outbound + inbound integration
- Setup for AWS hosting, router port-forward, and UAT testing

What the client site needs

- ServiceM8 account
- Yeastar TG400 (or equivalent supported gateway) with SIM(s)
- Office router with a static public IP and simple port-forward rules
- Domain/DNS for HTTPS in production (temporary hostname works for testing)

Suggested positioning for sales

"Keep customers informed automatically — booking confirmed, tech on the way, job done — using your own SMS hardware, without leaving ServiceM8."

Demo screenshots use sample data for illustration. Branding and templates are configured per client.
